Abstract In this article, the \((G'/G)\)-expansion method has been implemented to find the new travelling wave solutions of nonlinear evolution equations of fractional order. For this, the fractional complex transformation method has been used to convert fractional order partial differential equation to ordinary differential equation. Then, \((G'/G)\)-expansion method has been implemented to celebrate the series of new travelling wave solutions to fractional order coupled Burgers’ equations.

Keywords Travelling Wave Solutions, Fractional Complex Transformation, \((G'/G)\)-Expansion Method, Fractional Calculus, Nonlinear Coupled Burgers’ Equations

1. Introduction

Nonlinear evolution equations have been the area under discussion in different branches of mathematical and physical sciences such as physics, biology, chemistry, etc. The analytical solutions of such equations are of fundamental importance since a lot of mathematical and physical models are described by the nonlinear evolution equations. Among the possible solutions nonlinear evolution equations, certain special form solutions may depend only on a single combination of variables such as travelling wave variables.

Knowing the importance of nonlinear evolution equations, in the literature, the variety of approaches exist to find the travelling wave and numerical solutions to nonlinear problems. Some of its cited here, the adomian decomposition method\([7]\) and generalized differential transform method\([8]\) have been used to find the numerical solutions for the space- and time-fractional coupled Burgers’ equations. The \((G'/G)\) –expansion method was introduced, by Wang et al.\([6]\), to find the travelling wave solutions of nonlinear evolution equations. This method was further extended\([9]\) to find the solutions of fractional order differential equations. The Jacobi elliptic function expansion method\([10]\), the tanh-function method for finding solitary wave solutions\([11]\), the homotopy perturbation method\([12]\) have been applied to handle the nonlinear evolution equations etc.

In this article, a new approach has been used to find the series of travelling wave solutions to nonlinear evolution equations of fractional order using the fractional complex transformation\([3]\) and the \((G'/G)\)-expansion method\([6]\), in the sense of Jumarie’s modified Riemann-Liouville derivative. For this, we first use the fractional complex transformation to convert into ordinary differential equations. Then, the obtained ODE has been converted into \((G'/G)\) polynomial form. Using the homogenous balance and second order linear ordinary differential equation \(G''(\xi) + \lambda G' (\xi) + \mu G (\xi) = 0\) with the aid of computation, the new travelling wave solutions of \((G'/G)\) polynomial form has been calculated. As application the nonlinear coupled Burgers’ equations\([6]\) with time-space fractional derivatives has been considered, which has the following form:

\[
\begin{align*}
\frac{\partial^\alpha u}{\partial x^\alpha} &- \frac{\partial^2 u}{\partial x^2} + 2u \frac{\partial f(u)}{\partial x} + a \frac{\partial^\beta (uv)}{\partial x^\beta} = 0, \\
\frac{\partial^\alpha v}{\partial x^\alpha} &- \frac{\partial^2 v}{\partial x^2} + 2v \frac{\partial f(v)}{\partial x} + b \frac{\partial^\beta (uv)}{\partial x^\beta} = 0, \quad t > 0, 0 < \alpha, \beta \leq 1.
\end{align*}
\]

The rest of the article is organized as follows, in section 2 the basic definitions and properties for the fractional calculus are being considered regarding to modified Riemann-Liouville derivative. In section 3, the extended \((G'/G)\)-expansion method has been proposed to find the new travelling wave solutions for NPDEs of fractional order with the help of fractional complex transformation. As an application, the new travelling wave solutions of nonlinear coupled Burgers’ equations have been discussed in section 4. In the last section 5, the conclusion has been drawn.

2. Background on Fractional Calculus

In this section, the proposed method has been applied in the sense of the Jumarie’s modified Riemann-Liouville...
derivative[4] of order α. For this, some basic definitions and properties of the fractional calculus theory are being considered (for details see[5]). Thus, the fractional derivatives can be defined following[4] as:

\[
\frac{\partial^\alpha f(x)}{\partial x^\alpha} = \begin{cases} 
\frac{1}{\Gamma(-\alpha)} \int_{0}^{x} (x - \xi)^{-\alpha-1} f(\xi) d\xi, & \alpha < 0, \\
\frac{1}{\Gamma(1-\alpha)} \int_{0}^{x} (x - \xi)^{-\alpha} f(\xi) d\xi, & 0 < \alpha < 1, \\
(f^\gamma(\xi))^{\alpha-n}, & n \leq \alpha < n + 1, \ n \geq 1.
\end{cases}
\]

Moreover, some properties for the modified Riemann-Liouville derivative have also been given as follows:

\[
\frac{\partial^\alpha x^\nu}{\partial x^\alpha} = \frac{\Gamma(1+\nu)}{\Gamma(1-\alpha+\nu)} x^{\nu-\alpha}, \ \nu > 0, 
\]

\[
\frac{\partial^\alpha (u(x) v(x))}{\partial x^\alpha} = v(x) \frac{\partial^\alpha u(x)}{\partial x^\alpha} + u(x) \frac{\partial^\alpha v(x)}{\partial x^\alpha}, 
\]

\[
\frac{\partial^\alpha f(u(x))}{\partial x^\alpha} = \int_{0}^{u(x)} \left( \frac{\partial^\alpha f(u(\xi))}{\partial u^\alpha} \right) (u'(\xi))^\alpha. 
\]

The homogeneous balance technique can be used, to determine the positive integer \( m \), between the highest order derivatives and the nonlinear terms appearing in (3.2). After the substitution of (3.3) into (3.2) and using equation (3.4), we collect all the terms with the same order of derivatives and the nonlinear terms. The (\( G'/G \))-expansion method[6], can be performed using the following steps. For this, we consider the following NPDE (nonlinear partial differential equation) of fractional order

\[
P \left( u, \frac{\partial^\alpha u}{\partial x^\alpha}, \frac{\partial^\beta u}{\partial x^\beta}, \frac{\partial^\gamma u}{\partial x^\gamma}, \ldots \right) = 0, 
\]

where \( u \) is an unknown function and \( P \) is a polynomial of \( u \) and its partial fractional derivatives along with the involvement of higher order derivatives and nonlinear terms.

**Step 1:** First, we convert the NPDE of fractional order into nonlinear ordinary differential equations using the fractional complex transformation (2.6) introduced by Li et al.[3]. Hence, the travelling wave variable, defined in equation (2.6), permits us to reduce equation (3.1) to an ODE of \( u = u(\xi) \) in the following form

\[
P(u, u', u'', u''', \ldots) = 0. 
\]

**Step 2:** Suppose that the solution of equation (3.2) can be expressed as a polynomial of \( (G'/G) \) in the form:

\[
u(\xi) = \sum_{i=0}^{m} a_i \left( \frac{\partial}{\partial \xi} \right)^i, 
\]

where \( a_i \)'s are constants and satisfies the following second order linear ordinary differential equation

\[
G''(\xi) + \lambda G'(\xi) + \mu G(\xi) = 0, 
\]

where \( \lambda \) and \( \mu \) are constants

**Step 3:** The homogeneous balance technique can be used, to determine the positive integer \( m \), between the highest order derivatives and the nonlinear terms appearing in (3.2). After the substitution of (3.3) into (3.2) and using equation (3.4), we collect all the terms with the same order of \( (G'/G) \) together. Equate each coefficient of the obtained polynomial to zero, yields the set of algebraic equations for \( K, L, M, \lambda, \mu \) and \( a_i \) \( (i = 0, \pm 1, \pm 2, \ldots, \pm m) \).

**Step 4:** After solving the system of algebraic equations, and using the equation (3.4), the variety of travelling wave solutions can be obtained using the generalized solutions of equation (3.4).

### 3. Description of the \((G'/G)-Expansion\) Method

\[
(G'/G) = \left\{ \begin{array}{l}
\frac{\lambda + \sqrt{\lambda^2 - 4\mu}}{2} \sqrt{C_1 \sinh (\xi \sqrt{\lambda^2 - 4\mu}/2) + C_2 \cosh (\xi \sqrt{\lambda^2 - 4\mu}/2)}, \quad \lambda^2 - 4\mu > 0, \\
\frac{\lambda - \sqrt{\lambda^2 - 4\mu}}{2} \frac{C_1 \cosh (\xi \sqrt{\lambda^2 - 4\mu}/2) + C_2 \sinh (\xi \sqrt{\lambda^2 - 4\mu}/2)}{C_1 + C_2}, \quad \lambda^2 - 4\mu < 0, \\
\frac{\lambda - \sqrt{\lambda^2 - 4\mu}}{2} \frac{C_1 \cosh (\xi \sqrt{\lambda^2 - 4\mu}/2) + C_2 \sinh (\xi \sqrt{\lambda^2 - 4\mu}/2)}{C_1 + C_2}, \quad \lambda^2 - 4\mu = 0,
\end{array} \right.
\]

where \( C_1 \) and \( C_2 \) are arbitrary constants.

### 4. Fractional Order Coupled Burgers’ Equations

In this section, the improved \((G'/G)-Expansion\) method has been used to construct the new travelling wave solutions for nonlinear space-time fractional coupled Burgers’ equations (1.1). For this, the following fractional complex transformation
\begin{align*}
u(x,t) = u(\xi), \quad \xi = \frac{Kx^\beta}{\Gamma(\beta + 1)} + \frac{Lt^\alpha}{\Gamma(\alpha + 1)}
\end{align*}

where \( K \) and \( L \) are constants, permits to reduce the equation (1.1) into an ODE. After integrating once, we have the following form:

\begin{align*}
A - Lu - K^2u' + Ku^2 + aK(\nu) &= 0 \\
B - Lv - K^2v' + Kv^2 + bK(\nu) &= 0
\end{align*}

(4.1)

Suppose that the solutions of above set of equations can be expressed by

\begin{align*}
u(\xi) &= \sum_{i=-m_1}^{m_1} \alpha_i \left( \frac{G'}{G} \right)^i,
\end{align*}

where \( \alpha_i, \beta_i \) are arbitrary constants. To determine these constants substitute these values into the equations (4.1), and by collecting all the terms with the same power of \( (G'/G) \) together. Equate each coefficient equal to zero; this yields a set of following algebraic equations:

\begin{align*}
A - L\alpha_0 - K^2(\alpha_{-1} - \mu\alpha_1) + Ka_0^2 + 2K\alpha_{-1}\alpha_1 + aK(\alpha_{-1}\beta_1 + \alpha_0\beta_0 + \alpha_1\beta_1) &= 0, \\
-\mu\alpha_{-1} - \lambda K^2 \alpha_{-1} + 2K\alpha_{-1}\alpha_0 + aK(\alpha_1\beta_1 + \alpha_0\beta_0) &= 0, \\
-\mu\alpha_{-1} + \lambda K^2 \alpha_1 + 2K\alpha_0\alpha_1 + aK(\alpha_0\beta_1 + \alpha_1\beta_0) &= 0, \\
K^2 \alpha_1 + K\alpha_1^2 + aK\alpha_1\beta_1 &= 0, \\
-\mu K^2 \alpha_{-1} + K\alpha_{-1}^2 + aK\alpha_{-1}\beta_{-1} &= 0, \\
-\mu K^2 \beta_{-1} + K\beta_{-1}^2 + bK\alpha_{-1}\beta_{-1} &= 0, \\
K^2 \beta_1 + K\beta_1^2 + bK\alpha_{-1}\beta_{-1} &= 0, \\
-\mu K^2 \beta_{-1} + 2K\beta_0\beta_1 + bK(\alpha_0\beta_1 + \alpha_1\beta_0) &= 0, \\
-\mu \beta_{-1} - \lambda K^2 \beta_{-1} + 2K\beta_0\beta_1 + bK(\alpha_{-1}\beta_1 + \alpha_0\beta_0 + \alpha_1\beta_1) &= 0, \\
B - L\beta_0 - K^2(\beta_{-1} - \mu\beta_1) + K\beta_0^2 + 2K\beta_{-1}\beta_1 + bK(\alpha_{-1}\beta_1 + \alpha_0\beta_0 + \alpha_1\beta_1) &= 0.
\end{align*}

After solving these algebraic equations with the help of software Maple, yields the following three families for the values of \( \lambda, \mu, \alpha_i, \beta_i, (i = -1, 0, 1) \).

**Case 1:**

\begin{align*}
A &= \frac{\beta_1^2 - \beta_1(a^2 - 1)}{(b - 1)} , \quad B = \frac{2\beta_1^2 - \beta_1(ab - 1)}{(b - 1)} , \quad K = -\beta_1 , \quad \mu = -\frac{\beta_1(ab - 1)}{\beta_1(b - 1)} , \quad \lambda = 0, \\
\alpha_{-1} &= \frac{\beta_1(a - 1)}{(b - 1)} , \quad \alpha_0 = \alpha_1 = 0, \quad \beta_{-1} = \beta_1 , \quad \beta_0 = 0, \quad \beta_1 = \beta_1.
\end{align*}

Where \( \alpha_{-1}, \beta_{-1}, \beta_1 \) and \( \mu \) are arbitrary constants with \( \beta_1 \neq 0 \).

**Case 2:**

\begin{align*}
A &= \frac{2K^2\alpha_{-1}(a + ab - 2)}{(a - 1)} , \quad B = \frac{K^2\alpha_{-1}(b - 1)(3 + b)}{(a - 1)} , \quad K = K , \quad L = L , \quad \mu = -\frac{\alpha_{-1}(ab - 1)}{K(a - 1)} , \quad \lambda = 0, \\
\beta_{-1} &= \frac{(b - 1)}{(a - 1)} , \quad \alpha_{-1} = \alpha_{-1} , \quad \alpha_0 = 0, \quad \alpha_1 = -K , \quad \beta_{-1} = \beta_{-1} , \quad \beta_0 = 0, \quad \beta_1 = 0.
\end{align*}

Where \( \alpha_{-1}, \alpha_1, \beta_{-1} \) and \( \mu \) are arbitrary constants.

**Case 3:**

\begin{align*}
A &= \frac{K^2\beta_{-1}(a-1)}{(b-1)} , \quad B = K^2\beta_{-1} , \quad K = K , \quad L = -\lambda K^2 , \quad \mu = \frac{\beta_{-1}(ab-1)}{K(b-1)} , \quad \lambda = \lambda, \\
\alpha_{-1} &= \frac{\alpha_{-1}}{(b-1)} , \quad \alpha_{-1} = \alpha_{-1} , \quad \alpha_0 = 0, \quad \alpha_1 = 0, \quad \beta_{-1} = \beta_{-1} , \quad \beta_0 = 0, \quad \beta_1 = 0.
\end{align*}

Where \( \alpha_{-1}, \beta_{-1} \) and \( \mu \) are arbitrary constants.

Substituting the above results into the set of equations (4.2) and combining with the equations (3.5), the new series of travelling wave solutions to the equation (1.1) can be celebrated.

From Case 1, the following travelling wave solutions can be obtained.
When $\lambda^2 - 4\mu > 0$, we have

$$u_1(\xi) = \frac{\mu K(a - 1)}{(ab - 1)} \left( \frac{\lambda}{2} + \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right) \left( C_1 \sinh \left( \xi \sqrt{\lambda^2 - 4\mu/2} \right) + C_2 \cosh \left( \xi \sqrt{\lambda^2 - 4\mu/2} \right) \right)$$

and

$$v_1(\xi) = \frac{\mu K(b - 1)}{(ab - 1)} \left( \frac{\lambda}{2} + \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right) \left( C_1 \sinh \left( \xi \sqrt{\lambda^2 - 4\mu/2} \right) + C_2 \cosh \left( \xi \sqrt{\lambda^2 - 4\mu/2} \right) \right)$$

$$- K \left( \frac{\lambda}{2} + \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right) \left( C_1 \sinh \left( \xi \sqrt{\lambda^2 - 4\mu/2} \right) + C_2 \cosh \left( \xi \sqrt{\lambda^2 - 4\mu/2} \right) \right),$$

(4.3)

where $\xi = \frac{Kx^\beta}{r^{(\beta + 1)}} + \frac{Lt^a}{r^{(a + 1)}}$.

When $\lambda^2 - 4\mu = 0$, we have the solutions of the form

$$u_2(\xi) = \frac{\mu K(a - 1)}{(ab - 1)} \left( \frac{\lambda}{2} + \frac{C_2}{C_1 + C_2} \right)$$

and

$$v_2(\xi) = \frac{\mu K(b - 1)}{(ab - 1)} \left( \frac{\lambda}{2} + \frac{C_2}{C_1 + C_2} \right) - K \left[ \frac{\lambda}{2} + \frac{C_2}{C_1 + C_2} \right],$$

(4.4)

with $\xi = \frac{Kx^\beta}{r^{(\beta + 1)}} + \frac{Lt^a}{r^{(a + 1)}}$.

When $\lambda^2 - 4\mu < 0$, we have the solutions of the form

$$u_3(\xi) = \frac{\mu K(a - 1)}{(ab - 1)} \left[ - \frac{\lambda}{2} + \frac{\sqrt{4\mu - \lambda^2}}{2} \left( - C_1 \sin \left( \xi \sqrt{4\mu - \lambda^2/2} \right) + C_2 \cos \left( \xi \sqrt{4\mu - \lambda^2/2} \right) \right) \right]^{-1}$$

and

$$v_3(\xi) = \frac{\mu K(b - 1)}{(ab - 1)} \left[ - \frac{\lambda}{2} + \frac{\sqrt{4\mu - \lambda^2}}{2} \left( - C_1 \sin \left( \xi \sqrt{4\mu - \lambda^2/2} \right) + C_2 \cos \left( \xi \sqrt{4\mu - \lambda^2/2} \right) \right) \right]^{-1}$$

$$- K \left[ - \frac{\lambda}{2} + \frac{\sqrt{4\mu - \lambda^2}}{2} \left( - C_1 \sin \left( \xi \sqrt{4\mu - \lambda^2/2} \right) + C_2 \cos \left( \xi \sqrt{4\mu - \lambda^2/2} \right) \right) \right],$$

(4.5)

where $\xi = \frac{Kx^\beta}{r^{(\beta + 1)}} + \frac{Lt^a}{r^{(a + 1)}}$.

Especially, if we take $C_2 = 0$, in equations (4.3), then the following solutions can be obtained.

$$u_4(\xi) = \frac{\mu K(a - 1)}{(ab - 1)} \left( \frac{\lambda}{2} + \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right)$$

and

$$v_4(\xi) = \frac{\mu K(b - 1)}{(ab - 1)} \left[ - \frac{\lambda}{2} + \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right] - K \left[ - \frac{\lambda}{2} + \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right],$$

And if we take $C_2 = 0$, in equations (4.5), then the following solutions can be obtained.

$$u_5(\xi) = \frac{\mu K(a - 1)}{(ab - 1)} \left[ - \frac{\lambda}{2} - \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right] - K \left[ - \frac{\lambda}{2} - \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right],$$

and

$$v_5(\xi) = \frac{\mu K(b - 1)}{(ab - 1)} \left[ - \frac{\lambda}{2} - \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right] - K \left[ - \frac{\lambda}{2} - \frac{\sqrt{\lambda^2 - 4\mu}}{2} \right].$$

Similarly, as the solutions have been established for case 1, we can construct the corresponding travelling wave solutions from cases 2 and 3.
5. Conclusions

The extended \((G'/G)\)-expansion method has been applied to solve the fractional partial differential equation. As an application, a series of new travelling wave solutions for the space-time fractional order coupled Burgers’ equations have been successfully found. It may be observed that, the nonlinear fractional complex transformation ensures that a certain fractional order differential equations can be turned into ordinary differential equations of integer order. Afterwards, the obtained ODEs can be expressed by a polynomial in \((G'/G)\), from where its solution can be obtained using the second order equation \(G''(\xi) + \lambda G'(\xi) + \mu G(\xi) = 0\). Since, the homogeneous balancing principle has been used, so we can claim that this method can be applied to other fractional order partial differential equations where the homogeneous balancing principle is satisfied.
