Abstract *Thuja orientalis* (Commonly- Morpankhi, Family- Cupressaceae) is an evergreen, monoecious trees or shrubs used in various forms of traditional medicines and homeopathy in various ways. In traditional practices *Thuja* is used for treatment of bronchial catarrh, enuresis, cystitis, psoriasis, uterine carcinomas, amenorrhea and rheumatism. Recent searches in different parts of the world have shown that *T. orientalis* and its active component thujone have the great potential against a various health problems. *T. orientalis* preparations can be efficiently used against microbial/worm infection. It can be used as antioxidant, anticancer and anti-inflammatory agent. Instead of these effects, it can be also used as insecticidal, molluscicidal and nematicidal activity against different pests. The present review highlights the some important biological properties of *T. orientalis*.

Keywords *Thuja Orientalis*, Morpankhi, Thujone, Antimicrobial, Molluscicidal, Antimicrobial

1. Introduction

*Thuja orientalis* (Commonly- Morpankhi, Family- Cupressaceae) is a genus of coniferous trees. *T. orientalis* is an evergreen, monoecious trees or shrubs growing to 10-60 feet tall. The shoot are flat, leaves are scale like. The leaves are arranged in flattened fan shaped growing with resin glands [1]. Their leaves contain essential oils used to treat fungus infections, cancer, moles and parasitic worms. The essential oil derived from the leaves is toxic. α-thujone is useful as an insecticide and an antihelminthic agent for the treatment of parasitic worms[2]. However, α-thujone is a toxic substance that disrupts neurological signals in the brain. Ingestion of the essential oils of *Thuja* leaves can cause death[2]. Seed with a pair of narrow lateral wings, seedlings produces 2 cotyledons. The wood is light, soft and aromatic. *Thuja* poles also often used to make fence posts and rails. The wood of *Thuja* is commonly used for guitar sound boards[3]. It is used as a medicinal plant in various forms of traditional medicines like folk medicine, homeopathy and treatment of bronchial catarrh, enuresis, cystitis, psoriasis, uterine carcinomas, amenorrhea and rheumatism[4-6]. Oil of *Thuja* contains thujone which has been studied for its GABA (gamma-aminobutyric acid) receptor antagonistic, with potentially lethal properties[2]. A yellow dye is obtained from the young branches[7]. *Thuja* is also occasionally used for treating diseases of skin, blood, gastrointestinal tract, kidney, brain, warty excrescences, spongy tumors[6]. Dubey and Batra[8,9] reported that the hepato-protective activities and antioxidant activity of *Thuja occidentalis*. Anti- proliferative and apoptosis- inducing properties of *Thuja occidentalis* has been evaluated by Biswas *et al.*, [6].

2. Chemical Constituents

*Thuja orientalis* leaves contain rhodoxanthin, amentoflavone, hinokiflavone, quercetin, myricetin, carotene, xanthophylls and ascorbic acid. The fruit and roots are strongly aromatic. Distillation of the dried roots yields an essential oil having the following properties- Sp.gr.20°, 0.971[α]D, -22.5° nD20, 1.5055: acid val, 2.1 ester. Val. 26.27; ester. Val. After acetylation, 89.39; Carbons (as C10H16O), 5.65% and 50% in 7-8 vols of 95% alcohol[10]. The composition of the oil is as follows: a new bicyclic sesquiterpene 51.10; l-borneol, 17.10; bornyl acetate, 9.1; α-thujone and camphor, 5.6; and a new sesquiterpenenic alcohol. The seed yields fatty oil having the fallowing composition palmitic 5.28, stearic, 7.3; C18 unsaturated acids, 1829 (linolenic, 44.6%); and C20 unsaturated acids, 6.10%. The heartwood contains aromadendrin, taxifolin, widdrene, cedrol, thujiopsadiene, dehydro-α-curcumene, β-isobiotol and Curcumenether. It also contains an essential oil Ç is a complex blend of: Sesquiterpenic hydrocarbons (cuparenes) 40; alcohols (Cedrol, widdrol, cuparenols) 50; monoterpenic acids[10]. Nickavar *et al.*, [11] 19 and 28 compounds have been identified in the volatile oils of the fruit and leaf, respectively, while the fruit oil contained α-pinene (52.4%), 3-carene (14.2%), α-cedrol (6.5%) and phellandrene (5.1%), the leaf oil contained α-pinene (21.9%), α-cedrol (20.3%), 3-carene (10.5%) and limonene (7.2%) as the main components.

Thujone is a ketone and a monoterpene that occurs naturally in two diastereomeric forms: α-thujone and β-thujone[12].

3. Biological Effects

The main constituents of essential oils mono- and sesquiterpenes including carbohydrates, phenols, alcohols, ethers, aldehydes and ketones are responsible for the biological activity of aromatic and medicinal plants[12,13]. *Thuja orientalis* is used internally in the treatment of coughs, haemorrhages, excessive menstruation, bronchitis, asthma, skin infections, mumps, bacterial dysentery, arthritic pains and premature blandness[14]. The leaves are antipyretic, astringent, diuretic, emmenagogue, emollient, expectorant, refrigent, and stomachic[15,16]. Their use is said to improve the growth of hair[15]. The seed is aperients, lenitive and sedative. It is used internally in the treatment of palpitations, insomnia, nervous disorder and constipation in the elderly. The bark is used in the treatment of burn and scalds. The stems are used in the treatment of coughs, cold, dysentery, rheumatism and parasitic skin diseases[16]. Thujone was a weak inhibitor of acyl-CoA: lysophosphatidylcholine acyl-transferase activity in mouse brain synaptosomes compared to psychoactive cannabinoids[17].

3.1. Antibacterial Activity

Plants and their essential oils are potentially useful sources of antimicrobial compounds. *Thuja orientalis* contain large amounts of three substances (alpha, beta and gamma thujaplicin) that in low concentration would serve as chelators for *S. mutans*. It produced an inhibition zone of 30 and 22 mm in diameter against *A. alternata* and *C. Lunata*, respectively[20,21]. Mishra et al.[22] reported antifungal activity of aqueous leaf extract of *T. orientalis* against *Curvularia lunata*. The essential oils from leaves, twigs and stems of large trees and shrub-like trees of *Thuja sutchuenensis* were extracted by hydrodistillation and supercritical fluid extraction and analysed by GC and GC-MS. The essential oils exhibited a certain degree of antifungal activity against six strains of human pathogenic fungi[23].

3.2. Antifungal Activity

The essential oil showed antifungal activity in the inhibition zone against *Alternaria alternata* and *Curvularia lunata* in a direct bioautography assay by lipophilic leaf extract of *T. orientalis*. Best bioactive component (Rf = 0.80) was observed and noted for antifungal activity. It produced an inhibition zone of 30 and 22 mm in diameter against *A. alternata* and *C. Lunata*, respectively[20,21]. Mishra et al.[22] reported antifungal activity of aqueous leaf extract of *T. orientalis* against *Curvularia lunata*. The essential oils from leaves, twigs and stems of large trees and shrub-like trees of *Thuja sutchuenensis* were extracted by hydrodistillation and supercritical fluid extraction and analysed by GC and GC-MS. The essential oils exhibited a certain degree of antifungal activity against six strains of human pathogenic fungi[23].

3.3. Antiviral Activity

The chemical composition of the essential oil of *T. orientalis* was determined by GC/MS analysis. Essentials oils have been evaluated for their inhibitory activity against Sever Acute Respiratory Syndrome *Coronavirus* (SARS-Coronavirus) and Herpes Simplex Virus Type-1 (HSV-1) replication *in vitro* by visually scoring of the virus-induced cytopathic effect post-infection[24,25]. Several researches have demonstrated that allopatic extracts of *T. orientalis* could be used as strong antiviral agents against plant and animal viruses[26,27].

3.4. Inflammatory Activity

Vascular inflammation is involved in the inhibition and progression of cardiovascular disease including atherosclerosis. Anti-vascular inflammatory activity of an aqueous extract of *T. orientalis* (ATO) and its possible mechanisms were investigated in human umbilical vein endothelial cells (HUVECs)[28]. Pre- incubation of ATO inhibited tumor necrosis factor and also inhibited U937 monocytes adhesion to HUVECs stimulated by tumor necrosis factor (TNF) suggesting that it may inhibit the binding of monocytes to endothelium. Furthermore, ATO significantly inhibited TNF-induced production of intracellular reactive oxygen species (ROS). Overall, ATO has an anti- inflammatory activity which is at least in part, is due to the decrease in the TNF-induced endothelial adhesion to monocytes by inhibiting intracellular ROS production, NF-kB activation and cell adhesion molecule in HUVECs[28,29].

3.5. Anticancer Activity

Strong 5αa-reductase inhibitor are extracted and fractionated from *T. orientalis* and purified as diterpenes in isolated form[30]. The inhibitors are used either on their own or as active ingredients of therapeutics in the treatment of diseases caused by the over activity of 5αa-reductase or the hypersecretion of androgens, such as male baldness, androgenetic alopecia, hirsutism, acne, prostatomegaly and cancer of the prostate[30,31]. Dubey and Batra[8,9] reported that the hepato-protective activities and antioxidant activity of *Thuja occidentalis* linn. Anti-proliferative and apoptosis-inducing properties of thujone-rich fraction (TRF) separated from *Thuja occidentalis*. Their possible anti-cancer potentials have been noted in the malignant melanoma cell line A375[6]. Sunila et al.[32] concluded that a polysaccharide,
or long-chain sugar molecule, derived from *Thuja* leaves extract decreased the inflammation caused by cancer. It also prevented the cancer from metastasizing, or spreading throughout the body.

### 3.6. Larvicidal Activity

Larvicidal activities of *T. orientalis* oil against 4th-instar larvae of *Aedes aegypti* and *Culex pipiens pallens* has been observed by Ju-Hyun et al.[33]. Larvicidal activity of *T. orientalis* leaf oil was higher than those of stem, fruit, and seeds oils. Essential oils of leaves and fruits of *T. orientalis* at 400 ppm caused 100% and 71.6% mortalities against *A. aegypti*[33]. The larvicidal activity was observed from various age class (I-III) and found strong mortality in age class of II of *T. orientalis* against *Aedes aegypti* and *Culex pipiens pallens* larvae. Leaf part and age class II of *T. orientalis* has strong larvicidal activity against *Aedes aegypti* and *Culex pipiens pallens*. Leaf oil of *T. orientalis* shows natural larvicides against *Aedes aegypti* and *Culex pipiens pallens*[33].

### 3.7. Insecticidal Activity

Leaf extracts of *T. orientalis* shows a repellent activity against *Chilo partellus*. *T. orientalis* ether extract (68.63%), acetone extracts (67.51%) have sufficient repellent action [34]. Foliar application of semi-solid crude extract of *T. orientalis* on maize was very effective against *Chilo partellus*[35].

### 3.8. Nematicidal Activity

Ethanolic extract of *Thuja orientalis* leaf concentrations (20,40,60, and 80%) at 3 time intervals caused mortality in egg juvenile of *Meloidogyne incognita*[36]. It revealed a linear relationship between the concentration of the plant extract and the number of eggs hatched. Mortality of juveniles was directly proportional to the concentration and time of plant extracts[36].

### 3.9. Molluscicidal Activity

Singh and Singh[37] reported that the ethanol extract of *T. orientalis* leaf (24 h LC₅₀ 32.74 mg/l) and column purified fraction (24 h LC₅₀ 29.25 mg/l) were potent molluscicide against *Lymnaea acuminata*. Thujone (24 h LC₅₀ 08.09 mg/l) was identified as active molluscicidal component in *T. orientalis*. The molluscicidal activity of leaf/fruit of *Thuja orientalis* and their active components/column purified fraction with synergist Piperonyl butoxide (PB) and MGK-264 (ENT 8184) was studied in binary combination (1:5) against *L acuminata*. Combination of *T. orientalis* leaf/thujone or fruit powder/column extract of *T. orientalis* fruit with PB or MGK-264 indicated synergised the toxicity up to 189.02 times. Toxicity of binary combination was increased hundreds folds than their individual components indicating synergistic action[38]. Sub-lethal (40% and 80% of 24h LC₅₀) in vivo treatments of column purified fraction of *Thuja orientalis* and their active molluscicidal component thujone significantly inhibited the acetylcholinesterase (AChE), acid and alkaline phosphatase (ACP/ALP) activities in the nervous tissue of *Lymnaea acuminata* [39].

It can be concluded from the ongoing literature that *T. orientalis* has the great potential against a number of health problem viz. bacterial, fungal and worm infection. It has antioxidant, antiviral, insecticidal nematicidal and molluscidal activity. Recently, it has shown carcinogenic property. It needs greater attention by the researchers to explore its full potential and efficient use in the human welfare.
